5.4 Relationship Compounding - The 90-Day Ally Engine

Elite private strategy - not for redistribution

WAR-ROOM NOTES - 5.4 Relationship Compounding

THE 30/10/10 IS A NETWORK-PORTFOLIO THEORY

In radio, a 30-ally network with 10 warm and 10 active is the minimum viable moat: enough active allies to float a campaign, enough warm allies to activate a 90-day pipeline, enough total allies to survive any single relationship's decay. The portfolio is re-ranked every 30 days because relationships are decaying assets: an active ally becomes warm in 60 days of silence, warm becomes cold in 180. The re-rank forces the maintenance. Without it, the moat erodes invisibly - which is why most artists have a list of names and no network at all.

THE ASSET/ASK BALANCE SHEET (THE ONLY METRIC THAT MATTERS)

For each ally, track the ratio of asks to assets. A row with 3 asks and 0 assets is draining the account; a row with 0 asks and 2 assets is accruing. The engine's command rule: no ask without a prior asset - the asset doesn't have to be big, it has to be sent. This single discipline keeps every relationship compounding. Most artists' relationships die of overdraft - they asked twice, gave nothing, and then wondered why the well is dry.

THE INTRO WEB IS THE NETWORK GRAVITY ENGINE

Introductions are the only multiplier in a relationship system: they turn your reputation into a hub rather than a node. Two intros a month creates 24 flows a year; each flow that lands makes the next intro easier. The operator's network compounds faster than their catalog - and when the catalog is finally great, the network is already enormous. Build the web before you need it.

THE 90-DAY LOOP IS THE ENGINE'S CLOCK, NOT A METAPHOR

Day 0 re-adds, day 14 value drops, day 45 check-ins, day 90 re-ranks: each beat keeps the network warm without demanding 3 hours a day. The loop also generates the audit data (Module 6.4) - every beat's outcome feeds the proof stack and the growth curve. The loop isn't maintenance. It's the engine's heartbeat.
