4.4 Adds & Next-Market Expansion Loops - One Station Into a Cascade

Elite private strategy - not for redistribution

WAR-ROOM NOTES - 4.4 Adds & Next-Market Expansion Loops

THE ADD IS A SALE CLOSED AND A RELATIONSHIP OPENED

Amateurs treat an add as the finish line. The 24/48/72 protocol treats it as the first purchase of a long customer relationship: the thank-you converts a transaction into an ally, the 48h broadcast converts a private win into social proof the station benefits from, and the 72h ALLY row converts a one-time event into a permanent asset. Each step compounds the relationship's value. Each step skipped costs the next release's re-add probability.

THE THREE-ASK PRIORITY (ORDER MATTERS)

Sister-station ask first: it's the lowest-cost ask and the highest-yield ask, because a format-sibling addition is nearly automatic once one station plays you. Repeat-support ask second: it converts a single slot into ongoing inventory. Referral ask third: it's the deepest trust ask, and it only works if the first two were handled well. Reversing the order burns trust: asking for a referral 48 hours after an add reads as a sales call, not a partnership.

THE MARKET EXPANSION CURVE (WHEN TO WIDEN)

Campaign 1 (20 stations): minimum 5 adds. Campaign 2 (30 stations): minimum 10. Campaign 3 (40 stations): minimum 15. The rule is not about station count - it's about system proof. Each stage's add count validates the previous stage's targeting and weapon quality. If campaign 1 yields 2 adds, the answer isn't "more stations," it's "better targeting" (Module 2.3) or "better weapon" (Module 3). Scaling an unproven loop is how artists waste a year sending 80 identical emails.

THE CASCADE IS A NETWORK EFFECT, NOT A LIST

The expansion loop's deep secret: station networks are dense. One add in a market unlocks the market's sister stations, partner formats, and program clusters - often 3-5 stations per add. The heat map should be updated not by search but by relationship traversal: every add produces 3 named cascade targets fast. A year of cascade farming beats a year of cold contact by an order of magnitude - because the second wave of every market arrives pre-warmed.

THE 21-DAY LOOP CLOCK

The expansion loop isn't a one-time process - it's a rhythm: campaign ends -> cascade week (asks + protocol) -> a week of thank-you economy (Module 5.2) -> next campaign arms. The empire grows in 21-day blocks, not in bursts of hope. The loop is the business. The releases are just the heartbeat.
